Intervention Summary

Collaborations between public health agencies, community-based organizations, and jail health services have implications for public health and safety efforts and have been proven to facilitate linkage to care after incarceration. Medical screenings that happen for all inmates through the jail intake process offer an opportunity to implement such interventions, as do booking processes and intervention intake. Jordan et al., introduce the concept of “Warm Transitions” as an integral part of implementing their HIV Continuum of Care Model by “applying social work tenets to public health activities for those with chronic health conditions including HIV-infection.” Absent “a caring and supportive warm transition approach,” pre-existing barriers to care and other stressors that come with the experience of incarceration and cycling in and out of correctional facilities will continue or be exacerbated after incarceration. Without transition assistance, people living with HIV who are released from jails are at risk of unstable housing; lack of access to health insurance and medication; overdose due to period of detoxification; exacerbation of mental health conditions due to increased stress; and lack of social supports, when exposed to the same high risk communities from which they were incarcerated.

This intervention is intended for organizations, agencies, and individuals considering strengthening connections between community and jail health care systems to improve continuity of care for HIV-positive individuals recently released from jails. The following information is meant to provide an overview of the Transitional Care Coordination intervention to implement a new linkage program to for PLWH to support their care retention and engagement post-incarceration and as they re-enter the community.

Professional Literature

The United States has the highest incarceration rates of any industrialized country in the world. Approximately 1 out of every 100 people in the United States is incarcerated, and if rates persist, 1 in 15 Americans will have been incarcerated at some point in their lives. The U.S. Criminal Justice System includes Law Enforcement (police, sheriff, highway patrol, FBI, and others), Adjudication (courts), and Corrections (jails, prisons, probation, and parole). Most incarcerated individuals (85%) pass solely through jails. Yet most corrections spending is in state prisons, rather than in jails, which are dependent on local funding.
Jails are often the *de facto* health provider of last resort where people with low income, mental illness, unstable housing, substance use issues, and a range of social and health problems are concentrated. Further, while historic arrest rates tend to mirror the racial and ethnic demographics of the local community, the incarcerated population is predominantly men of color. Prior to jail admission, many individuals may have had barriers to accessing health care and support services due to structural inequalities, including poverty, unstable housing, limited educational attainment, and un- or under- employment. Co-occurring health and behavioral health conditions (e.g., substance abuse and mental illness) further exacerbate access to care issues (see also Figure 1). Additionally, people are less equipped to address health issues when faced with competing compelling needs related to survival, such as food and shelter. In these same communities, health inequities lead to higher rates of both incarceration and HIV. As a result, public health professionals working in jail settings have a unique opportunity to engage a population living with HIV and not engaged in care, in need of supportive services to access care after incarceration to achieve viral load suppression.

Jail-based health services treat populations at high risk for acquiring HIV and offer people an opportunity to know their HIV status. They may also provide transitional care coordination to facilitate linkage and re-engagement with the health care system after incarceration. Jail-based health services have the opportunity to:

- **Offer universal HIV testing**, particularly in jurisdictions with hyper endemic rates of incarceration, so that the offer of HIV testing in correctional health care settings mirrors that in community health settings;
- **Implement interventions** to prevent HIV transmission among populations that move into, dwell in, or leave correctional facilities, while delivering general interventions that decrease intimate partner/sexual violence, promote harm reduction and medication adherence, and address substance use;
- Ensure that health services in jails follow **international guidelines** for HIV care, including for the management of HIV comorbidities that occur at high frequency in incarcerated populations;
- Promote 2-way, **comprehensive communication** between correctional and community HIV providers to ensure that there are no gaps in care, treatment, and supportive services as people transition to and from their communities and correctional facilities.

The CDC strongly recommends jail-based HIV testing. Routine HIV screening in jails is also consistent with the National HIV/AIDS Strategy. Nonetheless, many HIV positive persons in jails are unaware of their HIV status or were not in HIV primary care at the time of jail admission. The majority of people pass through jail and are never sentenced to prison but return to the communities that they left. The transition period from incarceration back to the community is known to be a high risk period for: increased deaths, discontinuity of care and treatment (including ART), unstable housing, and opiate overdose. The adverse health outcomes that occur in this high risk period further underscore the need for transitional care coordination and support services.

If rates persist, 1 in 15 Americans will have been incarcerated at some point in their lives. If rates persist, 1 in 15 Americans will have been incarcerated at some point in their lives. If rates persist, 1 in 15 Americans will have been incarcerated at some point in their lives. If rates persist, 1 in 15 Americans will have been incarcerated at some point in their lives. If rates persist, 1 in 15 Americans will have been incarcerated at some point in their lives.
departments, local healthcare providers, and community-based organizations have a vested interest in the provision of HIV testing, treatment, and linkage to both care and treatment during and after incarceration. It is useful for health care and correctional staff to view jails as part of the continuum of care rather than independently, since this approach may help encourage strategic retention-in-care planning.

**Theoretical Basis**

A behavioral change theory is a combination of, “interrelated concepts, definitions, and propositions that present a systematic view of events or situations by specifying relations amount variables, in order to explain or predict the events or situations.”\(^3\) By grounding an intervention in theory, the component parts are intentionally sequenced to build off of one another to facilitate a change in health behavior.

The original **Transitional Care Coordination** intervention was grounded in the Transtheoretical Model of Behavior Change (using Stages of Change to lead to behavior change).\(^4\) The Stages of Change framework explains an individuals’ readiness to change, and provides strategies at six levels of behavior change (**precontemplation**, **contemplation**, **determination**, **action**, **relapse**, and **maintenance**) to move the individual into adopting the new health behavior. The Transtheoretical Model of Behavior Change builds off of the Stages of Change by adding 10 processes of change that address the process of overcoming barriers, reducing internal resistance to change, and commitment to a new health behavior. These processes are consciousness raising, dramatic relief, self-re-evaluation, environmental re-evaluation, self-liberation, helping relationships, counter conditioning, reinforcement management, stimulus control, and social liberation. The Model also includes decisional balance (the benefits and costs of changing) and self-efficacy (confidence in the ability to change health behavior and temptation to engage in unhealthy behavior) as core constructs.

**Intervention Components and Activities**

The central aim of the Care Transitional Coordination intervention is to facilitate the linkage of a client living with HIV to community-based care and treatment services after incarceration. Intervention activities include identifying and engaging people living with HIV during the jail stay, identifying “right fit” community resources, developing a client plan for their time during and post-incarceration, and coordinating activities needed to facilitate linkage to care after incarceration. These activities need to occur quickly because jail stays are often brief and the uncertainty around discharge dates presents a shorter window of opportunity to reach people leaving jail settings.\(^5\)

Transitional Care Coordination includes the following key activities while clients are incarcerated (pre-release):

1. HIV testing or self-disclosure information as well as mental health and substance abuse information after medical intake screening (occurring in the jail);
2. Recruitment (including informed consent) and enrollment into the intervention/program after medical intake screening;
3. Intensive case management intervention and individualized discharge plans (typically, within 24 hours and at least within 48 hours of medical intake);
4. HIV education, including risk reduction and treatment adherence counseling, ongoing during the jail stay;
The Project Manager coordinates all aspects of the intervention with jail and community-based staff and community partners. The Project Manager is responsible for:

- being the point of contact for the intervention and providing oversight of the project;
- providing administrative supervision to the care coordinators and the data manager;
- serving as the health liaison to the courts; and
- serving as the liaison with local jail administration, the Dissemination and Evaluation Center (DEC), and the Implementation Technical Assistance Center (ITAC).

The care coordinator has five primary responsibilities: patient engagement, patient education, discharge planning, care coordination, and facilitating a warm transition to the community and linking a client to care.

**Patient engagement during incarceration.** The Care Coordinator is responsible for:

- client engagement and assessment during the client’s jail stay; and
- conducting care coordination with jail- and community-based organizations.

**Patient education.** The Care Coordinator is responsible for:

- providing patient education on HIV, including treatment adherence, risk reduction as well as a range of other health-related topics (e.g. STI, hepatitis, and TB overviews; prevention strategies and safe sex negotiation; relapse prevention; symptoms evaluation, etc.).

**Discharge planning.** The Care Coordinator is responsible for:

- assessing client needs;
- developing a plan with client to address basic needs;
- identifying resources to facilitate access to community health care; and
- scheduling initial linkage appointment.

### Staffing Requirements

The following staff positions need to be developed and filled in order to successfully implement the intervention.

<table>
<thead>
<tr>

| **PROJECT MANAGER** | The Project Manager coordinates all aspects of the intervention with jail and community-based staff and community partners. The Project Manager is responsible for:  
- being the point of contact for the intervention and providing oversight of the project;  
- providing administrative supervision to the care coordinators and the data manager;  
- serving as the health liaison to the courts; and  
- serving as the liaison with local jail administration, the Dissemination and Evaluation Center (DEC), and the Implementation Technical Assistance Center (ITAC). |
| **CARE COORDINATOR** | The care coordinator has five primary responsibilities: patient engagement, patient education, discharge planning, care coordination, and facilitating a warm transition to the community and linking a client to care.  
**Patient engagement during incarceration.** The Care Coordinator is responsible for:  
- client engagement and assessment during the client’s jail stay; and  
- conducting care coordination with jail- and community-based organizations.  
**Patient education.** The Care Coordinator is responsible for:  
- providing patient education on HIV, including treatment adherence, risk reduction as well as a range of other health-related topics (e.g. STI, hepatitis, and TB overviews; prevention strategies and safe sex negotiation; relapse prevention; symptoms evaluation, etc.).  
**Discharge planning.** The Care Coordinator is responsible for:  
- assessing client needs;  
- developing a plan with client to address basic needs;  
- identifying resources to facilitate access to community health care; and  
- scheduling initial linkage appointment. |
Care coordination for care upon release. The Care Coordinator is responsible for:
- completing patient assessment and discharge plan to initiate the process of coordinating care upon release, meeting the person in jail and initiating follow-up to verify linkage to care after incarceration;
- arranging discharge medications and prescriptions; and
- obtaining consent to collaborate with external entities and individuals (e.g. community health providers, social service programs, courts).

Facilitating a warm transition to the community and linking a client to care. The care coordinator is responsible for:
- accompanying individuals who are newly released to appointments to ensure connection to care;
- coordinating community-based HIV care linkage services;
- providing home visits, appointment accompaniment, or transportation;
- conducting, arranging, or coordinating outreach activities to find individuals who fall out of care and facilitate re-engagement in community care;
- assessing and addressing basic needs like housing, food, clothing, etc.; and
- transitioning the client to the standard of care after 90 days post-incarceration.

The Clinical Supervisor is responsible for:
- Participating in case conferencing (as needed);
- Providing monthly (or as requested) individual clinical supervision to care coordinators; and
- Providing monthly group clinical supervision to intervention team (as needed)

This position is responsible for:
- Consenting patients into the study;
- Collecting and submitting data required for multi-site evaluation;
- Coordinating the collection of patient surveys, encounter forms, basic chart data abstraction, and implementation measures, and reporting them to the Dissemination and Evaluation Center (DEC); and
- Providing quality assurance reports and updates to intervention team about study referrals, enrollment retention, etc.

Staff Characteristics

All staff involved in the intervention need to be:
- able to deliver culturally appropriate services.
- non-judgmental and demonstrate empathy, professionalism, boundaries around personal philosophy/belief systems.
- genuinely interested in working with people incarcerated in jails.
- reflective of racial and ethnic backgrounds of client population with language ability as appropriate to meet client needs (as practicable).
- able to meet Department of Corrections’ security clearance criteria.
- willing to conform to Department of Corrections’ policies and are cognizant of guidelines regarding justice-involved persons working in jail.
The following are programmatic requirements that need to be addressed prior to implementation (prior to enrollment of clients in the jails) in order to facilitate a successful implementation:

- Establish relationships with the Jail and Department of Corrections to insure ongoing cooperation and support throughout implementation.
  - Assess what related work is already taking place within the jail.
  - Receive clearance for intervention implementation. Understand what materials and resources are or are not permissible within the jail and plan your program accordingly (for example, some jails do not allow laptops inside).
  - Invite corrections to join the collaboration and obtain a commitment for correction officers to provide escort services. Ideally assigned and dedicated officers will work in partnership with the team.
  - Negotiate for dedicated space to conduct intervention activities. Appropriate work space is essential to maintain patient confidentiality.
  - Determine role of jail security staff in project implementation and involve them in planning.
- Visit jail facilities to conduct a flow analysis. Walk through the health services unit and other relevant spaces to learn where services are delivered to identify space amenable to your program.
- Strengthen existing relationships with community-based organizations that are willing to work with HIV-positive individuals leaving jail.
  - Address need for telephone or in-person case conferences with community-based organizations during the jail stay (to facilitate a warm transition).
  - Develop mutual Memorandum of Understanding (MOU) Linkage Agreement with each community partner that includes a commitment to provide data that verifies linkage to care.
  - Assess organizational capacity at community-based organizations to insure their ability to consistently provide culturally competent transitional social supports to each inmate post-incarceration.
- Identify how access to health records and any Electronic Health Record (EHR) systems (including RSR data).
  - Establish a process for communication and information sharing of participating Ryan White care providers during and post-incarceration to streamline the client process and activities each client engages in. Providers should be prepared to address the operational issues involved in working with multiple jail-based and community-based providers of health care as patients are frequently transferred among jails, between jails and prisons, from jail to court, and from jail to the community.
- Additionally, DEII performance sites must assess their capacity to conduct process and outcome evaluation activities during the funding period.
The SPNS Jail Linkages projects were deemed cost-effective from a societal perspective with an average cost per client at $4,219. In an analysis of nine sites, the mean cost to sustain linkage to care post-incarceration for 6 months was $4,670. Health outcomes impacting costs (reductions in ED use and self-reported unstable housing and hunger when compared to themselves at baseline and at 6 Month follow-up) were found under the Transitional Care Coordination intervention including a reduction in emergency department use and homeless shelter stays.
